COMPILER DESIGN Multiple Choice Questions.

1. Compiler is a language translator but not an A. de-translator. B. preprocessor. C. language migratory D. assembler ANS: B
2. The front end of a language processor analysesand A. source program and semantics. B. IR and syntax rule C. source program and IR D. semantic and lexical ANS: B
3. The symbol table is built during A. lexical analysis. B. semantic analysis. C. syntax analysis. D. SP & TP analysis. ANS: A
4. The back end in the compiler performs A. memory allocation. B. code generation C. memory allocation & code generation. D. linking ANS: B
 5. A compiler is a that reads a program written in one language, and translates it into an equivalent program in machine language. A. software. B. instruction C. phase D. program ANS: D
6. The two parts of compilers are A. lexical and synthesis. B. source program and target program. C. analysis and synthesis. D. static checkers and interpreters. ANS: C
7. The part breaks up the source program into constituent pieces and creates an intermediate representation of the source program. A. synthesis part.

B. analysis. C. syntax. D. argumentation. ANS: C
 8. Which is the tool that reads a program, analysis it and attempts to discover potential bugs without running the program? A. Structure editors. B. Static checkers. C. Interpreters D. Pretty pointers. ANS: B
 9. The process of streaming of character that make up the source program which is read from left-to-right and grouped into tokens is called A. linear analysis. B. hierarchical. C. semantic analysis. D. streaming analysis. ANS: A
 10. The first and second basic rules of the hierarchical structure of a program are A. any identifier or number is an expression. B. defining expressions in terms of operators and non recursive. C. if identifier1:=exp2. D. while (exp1) do statement2 if (exp1) then statement2. ANS: A
11are the formalization of recursive rules that can be used to guide syntactic analysis. A. Grammar. B. Context sensitive grammar. C. Context-free grammar. D. Syntax free grammar. ANS: C
12. A is a data structure containing a record for each identifier, with fields for the attribute for the identifier. A. table. B. open file table. C. symbol table. D. lexical analyzer. ANS: C

	phases usually handle a large fraction of the errors detectable by
the compilers.	
A. syntax ,semantics.	
B. semantics ,lexical.	
C. error handler ,code generator.	
· · · · · · · · · · · · · · · · · · ·	
D. code generator ,semantics.	
ANS: A	
14 The intermediate representation	has a form calledwhich is like the
	which every memory location can act like a register.
	i which every memory location can act like a register.
A. two address code.	
B. single address code.	
C. three address code.	
D. three tier instruction.	
ANS: C	
15 The Coul above Cabeilea	i-4l
15. The final phase of the compiler	is the generation of target code, consisting of replaceable
A. intermediate code.	
B. semantic code.	
C. machine code	
D. buffer code	
1370 0	
ANS: C	
	onic version of machine code
16is a mnem	onic version of machine code.
16is a mnem A. Rational preprocessors.	onic version of machine code.
16is a mnem A. Rational preprocessors. B. Parse code.	onic version of machine code.
16 is a mnem A. Rational preprocessors. B. Parse code. C. Intermediate code.	onic version of machine code.
16is a mnemA. Rational preprocessors.B. Parse code.C. Intermediate code.D. Assembly code	onic version of machine code.
16 is a mnem A. Rational preprocessors. B. Parse code. C. Intermediate code.	onic version of machine code.
16 is a mnemA. Rational preprocessors.B. Parse code.C. Intermediate code.D. Assembly codeANS: D	
16 is a mnemA. Rational preprocessors.B. Parse code.C. Intermediate code.D. Assembly codeANS: D	onic version of machine code. two functions of loading and link-editing is called as
 16is a mnem A. Rational preprocessors. B. Parse code. C. Intermediate code. D. Assembly code ANS: D 17. The program that performs the 	
16is a mnem A. Rational preprocessors. B. Parse code. C. Intermediate code. D. Assembly code ANS: D 17. The program that performs the A. loaders.	
16is a mnem A. Rational preprocessors. B. Parse code. C. Intermediate code. D. Assembly code ANS: D 17. The program that performs the A. loaders. B. linkers.	
A. Rational preprocessors. B. Parse code. C. Intermediate code. D. Assembly code ANS: D 17. The program that performs the A. loaders. B. linkers. C. link-editor.	
A. Rational preprocessors. B. Parse code. C. Intermediate code. D. Assembly code ANS: D 17. The program that performs the A. loaders. B. linkers. C. link-editor. D. optimal code.	
A. Rational preprocessors. B. Parse code. C. Intermediate code. D. Assembly code ANS: D 17. The program that performs the A. loaders. B. linkers. C. link-editor.	
A. Rational preprocessors. B. Parse code. C. Intermediate code. D. Assembly code ANS: D 17. The program that performs the A. loaders. B. linkers. C. link-editor. D. optimal code. ANS: A	two functions of loading and link-editing is called as
A. Rational preprocessors. B. Parse code. C. Intermediate code. D. Assembly code ANS: D 17. The program that performs the A. loaders. B. linkers. C. link-editor. D. optimal code. ANS: A	two functions of loading and link-editing is called as
A. Rational preprocessors. B. Parse code. C. Intermediate code. D. Assembly code ANS: D 17. The program that performs the A. loaders. B. linkers. C. link-editor. D. optimal code. ANS: A 18. Which one of the following is not all the code. A. Semantic	two functions of loading and link-editing is called as
A. Rational preprocessors. B. Parse code. C. Intermediate code. D. Assembly code ANS: D 17. The program that performs the A. loaders. B. linkers. C. link-editor. D. optimal code. ANS: A 18. Which one of the following is not all the control of	two functions of loading and link-editing is called as
A. Rational preprocessors. B. Parse code. C. Intermediate code. D. Assembly code ANS: D 17. The program that performs the A. loaders. B. linkers. C. link-editor. D. optimal code. ANS: A 18. Which one of the following is not all the code. A. Semantic	two functions of loading and link-editing is called as

ANS: D	
A. Systemization. I Parsing C. Translation D. Phasing ANS: B	is a process of determining if a string of tokens can be generated by a grammer. B.
20. The technique A. schemes B. buffer C. semantics D. sentinels ANS: B	used for speeding up the lexical analyzer is
a token. A. fields B. table C. lexeme D. pattern ANS: C	is a sequence of characters in the source program that is matched by the pattern for
22. The phases of A. primary, from B. front, back. C. first, last. D. primary, posterior. ANS: I	
23. A parse tree is A. abstract B. concrete C. comparative D. replicating ANS: B	called assyntax tree.
24. Consider the st A. Count, increa B. Only count. C.; D. + ANS:	tatement count = count + increment; which is the token in the statement? ment.
25.	is the rule describing the set of lexemes that can represent a particular token in source

program.

C. Source D. Syntax ANS: B
26. In the compiler model, the parser obtains a string of tokens from the A. rest of front end. B. symbol table. C. lexical analyzer. D. source analyzer. ANS: C
27. The output from the parser is usually A. symbol table B. string. C. source programs. D. parse tree. ANS: D
28. Panic mode is a type of strategy. A. error detection. B. error avoidance. C. error recovery. D. error creation. ANS: C
29. Misspelling an identifier is an example for error. A. lexical B. syntactic C. semantic D. logical ANS: A
30. If an operator is applied to an incompatible operand then it is an example for error. A. lexical B. syntactic C. semantic D. logical ANS: C
31. Usually the error detection and recovery is a compiler is done in phase. A. lexical B. syntax C. semantic D. logical ANS: B
32. Which of the following is not an error recovery strategy? A. Panic mode. B. Phrase level

A. Lexeme B. Pattern

C. Error reproduction.

ANS: C
33. The manner in which the terminals and non terminals can be combined to form strings deals with of a grammar. A. start symbol. B. forward reference. C. backward reference. D. production ANS: D
34. Rightmost derivations are also called as derivations. A. conical B. canonical C. triangular. D. depth first ANS: B
35. A grammar that produces more than one parse tree for some sentence is said to be A. ambiguous B. semantic C. syntactic D. unambiguous ANS: A
36. An efficient non-backtracking from of top-down parser is called A. unpredective parser. B. predictive parser. C. ambiguous parser. D. sematic parser. ANS: B
37. In action of a shift reducer parser, the parser announces successful completion of parsing. A. shift B. reduce C. accept D. error ANS: C
38. In the synthesis analysis model of a compiler, the front end translates a source program into an code for the generation of target program. A. intermediate B. machine C. object D. lexical ANS: A
40. Syntax tree, postfix notations and three-address codes are example for language. A. source language.

D. Global correction.

B. machine C. compiler D. intermediate ANS: D
41. A linear representation of a syntax tree where it lists the nodes of a tree in which a node appears immediately after its children is notation. A. prefix B. postfix C. infix D. outfix ANS: B
42. The op field in quadruples contains for the operator. A. external code. B. arguments C. internal code. D. function ANS: C
 43. Listing pointers to triples, rather than listing the triples themselves is implementation. A. quadruples B. indirect triples. C. production D. start ANS: B
44. Translating a Boolean expression into three address code without generating code for any of the Boolean operators and without hiring the code is code. A. short circuit B. breaking C. choosing D. omitting ANS: A
 45. op,result,arg1 and arg2 are fields of A. triples. B. indirect triples. C. quadruples. D. three address code. ANS: C
46. An infinitively recursive call is an example for error. A. lexical B. syntactic C. semantic D. logical ANS: D

47. Elimination or replacement of unnecessary instruction in object code is called ______.

A. code replacement B. code elimination C. code improvement D. code optimization ANS: B
48. Optimization technique based on what happens across a basic block is called optimization. A. local code B. basic code C. global code D. lock code ANS: C
 49. Global optimizations are based on analysis. A. code flow B. data flow C. instruction flow D. program flow. ANS: B
50. Deduction of en expression using a constant at runtime is called A. compile time folding B. expression folding C. constant folding D. code folding. ANS: C
51. An is an important modification that decreases the amount of the code in a loop. A. code motion B. loop motion C. code elimination D. code deletion ANS: A
52. The transformation of replacing an expensive operation with a cheaper one is called A. operation reduction. B. operation replacement C. strength reduction D. size reduction. ANS: C
53. The final phase in a compiler model is A. code eliminator. B. code implementor C. code generator D. code optimizer. ANS: C
54. The input of the code generator is A. parse tree. B. intermediate code C. flow graph D. algorithm.

ANS: B
55. The maps the IR so that the code is generated in an efficient manner. A. optimizer B. encoder C. analyzer D. generator ANS: D
56. Code optimization & generation phases are often referred as A. design phase. B. back end C. optimization phase D. front end. ANS: C
57 selection involves choosing appropriate machine instruction to implement the IR statements. A. Registers B. Address C. Machine D. Instruction ANS: D
58 selection involves what values to keep in which register. A. Address B. Value C. Register D. Instruction ANS: C
 59 involves in deciding the order of execution of instructions. A. Instruction ordering. B. Execution ordering C. Sequence ordering D. Code ordering. ANS: B
60. The important criterion of a is to produce correct codes. A. code optimizer. B. code generator C. code implementer D. compiler ANS: C
61. The syntax trees and DAGs are representations. A. pictorial B. virtual C. linear D. graphical ANS: D
62. Postfix notations are representations. A. linear B. graphical C. virtual

D. three-address.

ANS: A
63. The architecture of has a significant impact on good code generation. A. code generator. B. code optimizer C. target machine D. source machine. ANS: A
64. Producing a relocatable machine language program is often called A. code module B. program module C. object module D. data module. ANS: B
65. The must map the IR program into a code sequence that can de executed. A. code analyzer. B. code optimizer C. code synchronizer D. code generator. ANS: D
A. a. Compiler B. Analyzer C. Register D. Generator. ANS: C
 67. Flow of control can enter the basic block only through of the block. A. end instruction. B. first instruction C. middle instruction D. leader instruction. ANS: A
68. The basic block becomes the mode of A. control graph. B. data graph C. flow graph D. sequence graph. ANS: B
69. The first instruction of a basic block is A. first block. B. leader block C. header block D. pointer block. ANS: D
70. Any instruction that follows conditional and unconditional jumps is A. leader B. jump C. header

D. first ANS: A
71can be represented in any form of data structure that is appropriate for graphs. A. Control graphs. B. Data graphs. C. Coded graphs D. Flow graph ANS: D
72. Many code transformations depend upon the of loops in a flow graph. A. conditions B. jump C. execution D. identification ANS: C
73. Local optimization enables improvement inof code. A. efficiency B. running time C. execution time D. compile time ANS: C
74. The important step in local optimization is transforming basic block to A. leader. B. flow graph. C. dag. D. IR. ANS:
75. DAG representation helps to eliminate A. data redundancy B. interrupts. C. redundant code. D. dead code. ANS: D
76 keeps track of the variables whose current value is in that register. A. Register counter B. Address descriptor. C. Stack pointer. D. Register descriptor. ANS: D
77function selects the register for each associated memory location. A. getReg(). B. ndReg(). C. selReg(). D. memReg(). ANS: A
78. A is a program that converts source language into target language.

A. compiler	
B. assembler	
C. translator	
D. analyzer	
ANS: A	
71.0.71	
79. Two parts of compilation are	
A. analysis and	
compilation. B. analysis and	
conversion. C. static and	
dynamic.	
D. analysis and synthesis.	
ANS: D	
ANS. D	
80. A takes as input a sequence of command s to build a source program.	
A. pretty printers.	
B. structure editors.	
C. static checkers.	
D. interpreters	
ANS: B	
AND. D	
81 is called parsing.	
A. Hierarchical	
analysis. B. Semantic	
analysis.	
C. Synthetic analysis.	
D. Syntax tree.	
ANS: A

Type checking is performed by A. syntactic analysis B. semantic analysis. C. lexical analysis. D. schematic analysis analysis. D. schematic analysis analysis. D. schematic analysis analysis. D. schematic analysis.	ior

D. loader ANS: D
86. When code of one file refers to a location in another file then it is A. internal references. B. external references. C. mutual references. D. explicit references. ANS: B
87. In a compiler, converts the stream of input characters into a stream of tokens A. syntax analyzer. B. semantic analyzer. C. type checker. D. lexical analyzer. ANS: D
88. A grammar is when a grammar have more than one parse tree generated with given sets of strings A. unambiguous B. absolute C. ambiguous D. reliable ANS: C
89. A is an input output mapping with syntax directed definition. A. notation B. symbol C. translation D. compilation ANS: C
90. A parse tree showing the attribute values at each node is called parse tree. A. inherited B. ambiguous C. production D. annotated ANS: D
91 is the process of determining if a string of tokens can be generated by a grammar A. Parsing B. Compiling C. Analyzing D. Translating ANS: A
92. The term denotes any finite set of symbols. A. strings B. languages C. alphabet D. digits ANS: C
93. A Language denoted by a regular expression is

A. regular language. B. regular grammar. C. regular alphabet. D. regular set. ANS: D
94. A deterministic finite automaton is a special case in which no state has A. e-transition B. one transition. C. two transition. D. three transition. ANS: A
95. Misspelling of an identifier falls under error. A. logical B. semantic C. syntactic D. lexical ANS: D
96 are syntactic variable that denote set of strings A. Terminal. B. Non terminal. C. Notational variables. D. Semantic variables. ANS: B
97. The digits 0,1,29 are called A. non terminal B. production C. derivations D. terminals ANS: D
98. A is a collection of rules for assigning type expressions to various parts of a program. A. system B. type system. C. semantic system. D. lexical system. ANS: B
99 rules govern the formation of valid statements in source language. A. Lexical B. Syntax C. Semantic D. Analysis ANS: B
 100. The performs lexical, syntax and semantic analysis of SP. A. back end. B. front end. C. middle end. D. middle wall end.
